## LAB 1

**Part 1** -Identify at least 4 challenges to fitting this data into the relational data model

1. There is missing data in the spreadsheet
2. The followers column has different data types and is representing different data points (i.e number of followers compared to individual followers usernames)
3. The stream data is not normalized. There dates are captured in different values and some rows have more than one date.
4. Video duration is also not normalized. It's captured in three different formats
